

# Human Elafin in explicit water: independent short MD pilots

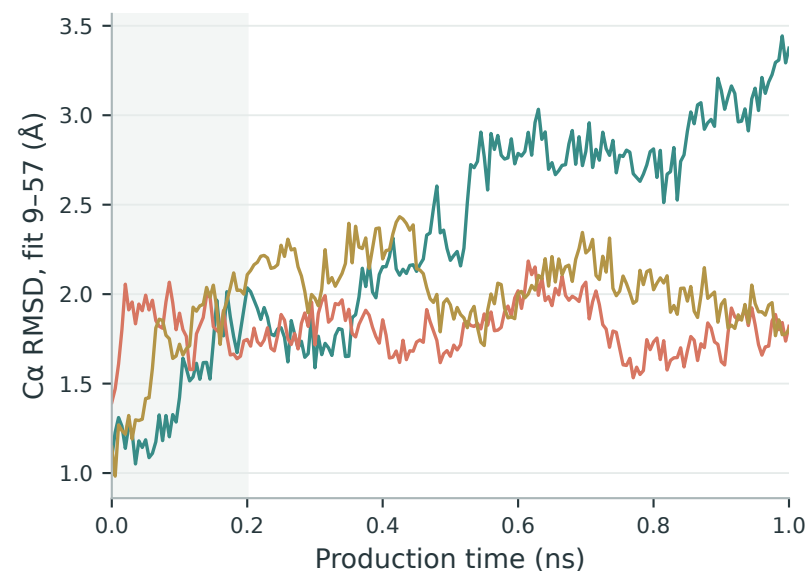

2REL conformer 1 | AMBER ff14SB / TIP3P-FB | 300 K, 1 bar, 0.15 M NaCl | 3 completed replicas

Each replica: 100 ps equilibration + 1 ns unrestrained production. Shaded early production is excluded from RMSF and summary means.

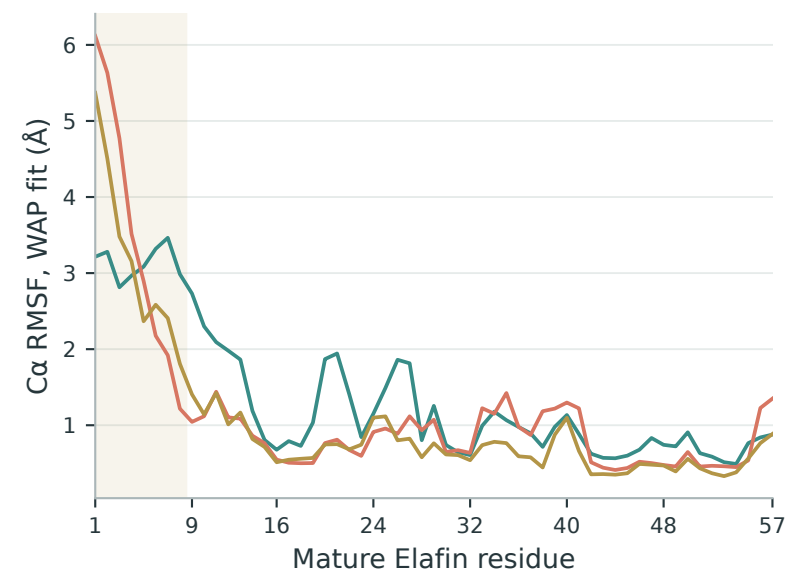

## a Full-length backbone displacement

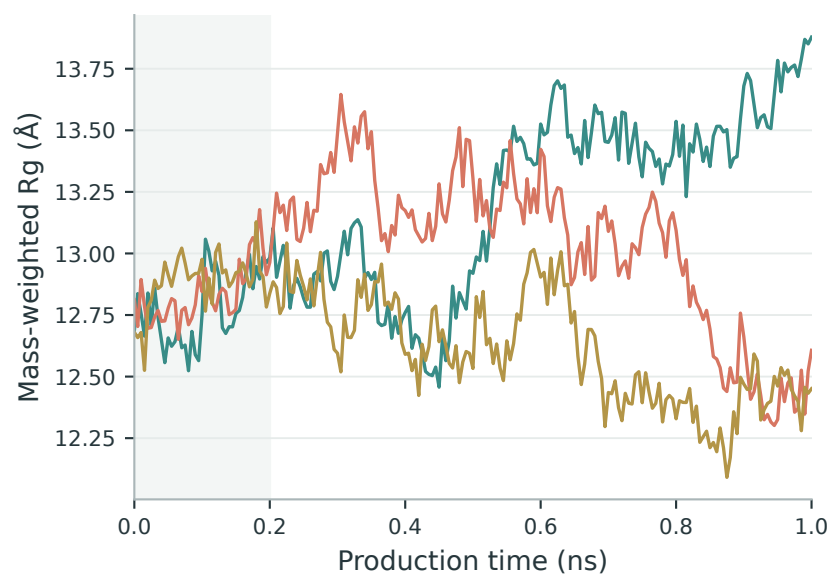

## b WAP-domain backbone displacement

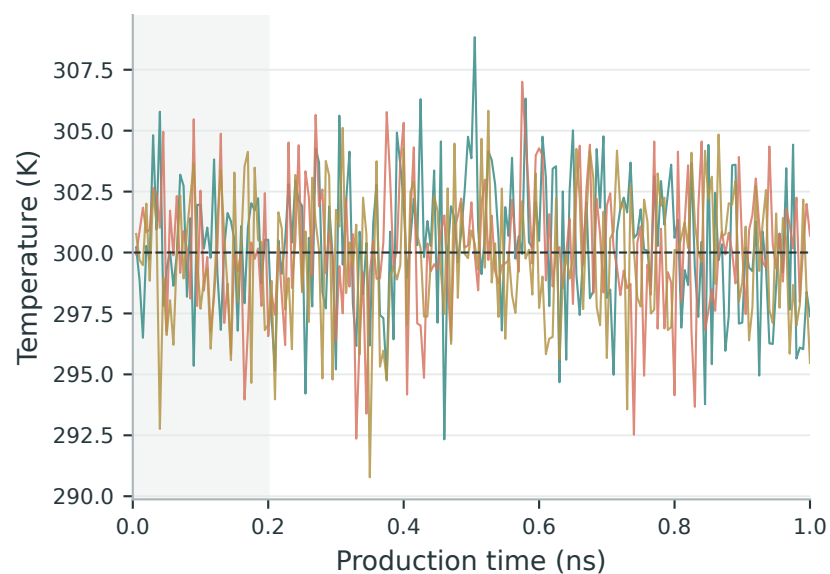

## c Temporal residue fluctuations

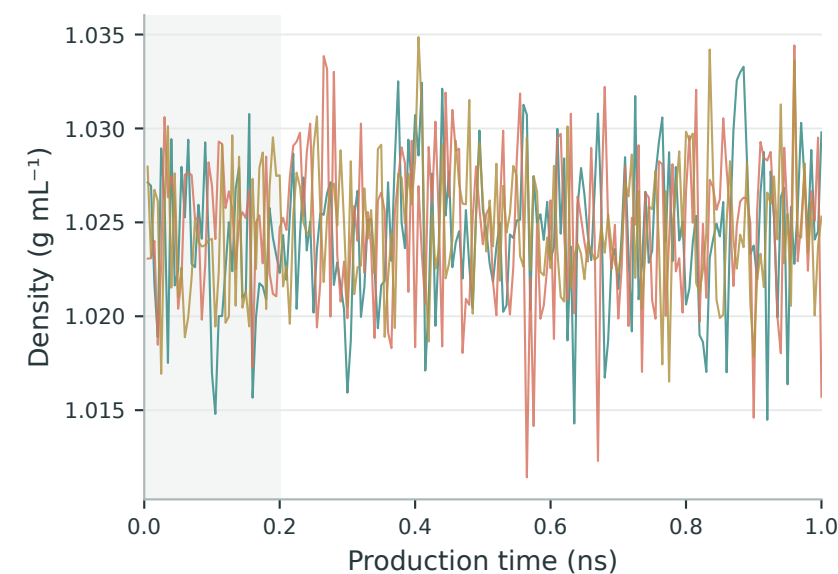

## d Protein compactness

## e Temperature control

## f Solvent-density relaxation

RMSD uses the minimized initial structure. RMSF uses each replica's 0.2-1.0 ns mean after WAP alignment; these are temporal MD fluctuations.
